

Choose Actual size or Scale: 100% in the print dialogue and turn off “shrink oversized pages”.
Check the ruler below against a real ruler first. If it reads 100 mm, every piece will line up.
Card stock of 160–250 gsm is worth it; plain paper curls and slides.

The game draws a hex texture into a square of $1.98 \times \text{hexViewSize}$, and every unit, building and tree into a rectangle of $1.4 \times 1.6 \text{ hexViewSize}$. Those same ratios are used here, so the pieces sit together exactly as they do on screen — a 160 px knight and a 128 px tower still come out the same size.

What is on each sheet

2	Unclaimed hexes (grey) — the map	print 2-4
3-8	Player hexes, one colour per sheet	1-2 each
9	Units: peasant, spearman, baron, knight	1
10	Buildings: castle, farm, tower, strong tower	1
11	Pines, palms and graves	1

hex peasant knight castle pine

Cut the hexes along the shared lines — one cut serves two hexes, so a sheet of 63 goes quickly. Build the map from grey hexes. When a hex is captured, swap it for one of the capturing player's colour. Unit, building and tree tokens sit on top of a hex; the colour underneath shows who owns them. Two sheets of grey and one colour sheet per player is enough for a normal game.
